Mining Remediation

How do we define effective remediation?

• Poses minimal hazard to human health and environment
• Isolates impacted materials from potential vectors (water, wind, people, wildlife)
• Sustains isolation and/or sequestration over a long term (What does “long term” really mean?)
What is Quality Remediation Engineering?

- Provides a sustainable bang for the buck
- Solves the targeted problems while mitigating associated risks
What makes projects go?

• Clear and concise explanations of data
• Quality Information Gathering
• Good Policy, Compromise, and Reasonable Expectations
• Relationships and Communication – Ultimately a well-executed project is about the people involved
Thank you for your time and attention
